(57) Abstract :

The present invention relates to an automatic heating device comprising of a double layered body 1 equipped with a heating element 2 for warming different parts of a user's skin, a control panel 3 for providing access to input commands regarding areas and modes of pain and generating signals based on the input commands, a pH sensor 5 for sensing pH of skin and generating input signals based on the measured pH, a control unit for comparing the input signals from pre-fed instructions and generating a command, a heating unit gets actuated for heating the first 4 and second layer 6 up to a desired level on receiving command from the control unit, a motorized roller 7 wrapped with a sheath 8 for limiting the radiation of the heat on the user's skin, wherein the sheath 8 covers the body 1 in a user defined manner.
