(57) Abstract :

A cloth maintenance device, comprising a body 1 attached with two hollow telescopic rods 2 for allowing hanging of a user's cloth of variable sizes, wherein the body 1 is installed with a fabric sensor 3 for detecting type of fabric of the cloth, a moisture sensor 4 integrated with a microcontroller for detecting level of moisture present in the cloth, wherein the microcontroller generates a command upon detection of the moisture, a control panel 5 wirelessly connected to the microcontroller that processes the data(s) received from the sensors and displays an estimated time along with a multiple options required to dry the cloth based on the fabric type and in accordance to which one of the options is selected by the user to carry out drying process, a blower 6 to blow air through conduits which is further dispersed inside the hanged cloth based on the selected option.
