(57) Abstract :

The present invention relates to a housing 1 associated with the smart steaming device, the housing is integrated with an image capturing unit 2 that captures images of said user's face and sends said images to a microcontroller that processes said data to determine skin type of said user's face. The primary sensor is coupled to the capturing unit 2 actuates upon receiving signals from the microcontroller to determine clogged pores, on the user's face. The container 3 associated with said device that stores water which upon heating produces vapor steam. A chamber 5 equipped within the housing 1 to store solutions. A temperature sensor integrated inside said housing 1 which determines current temperature within the housing 1. An electronically controlled valve, where said valve regulates flow of said steam by adjusting diameter of said valve in order to maintain said temperature calculated by said microcontroller. A port 7 sprays said steam onto said user's face or nose. Ref. Figure 1
